Chem 212 – Chromatography out-of-class assignment – Due \_\_\_\_\_

- 1. What would be the effect on a gas chromatographic peak of introducing the sample at too slow a rate (i.e., making a very slow injection into a gas chromatograph from a syringe)?
- 2. Describe the different contributions to peak broadening in a gas or liquid chromatographic system.
- 3. Consider the gas chromatographic separation of the esters methyl acetate, methyl propionate, and methyl n-butyrate on a column containing a stationary phase of intermediate polarity. What would be the retention order on this column? Would this retention order change if a non-polar stationary phase had been used instead? Explain. Would the retention times change on the non-polar column? Explain.

Methyl acetate	Methyl propionate	Methyl butyrate

- 4. What would be the effect of each of the following on the plate height of a gas chromatographic column? Explain each answer by referring specifically to terms in the equation that describes chromatographic peak broadening.
  - a) Increasing the weight of stationary phase relative to the support particles.
  - b) Increasing the flow rate.
  - c) Reducing the particle size of the packing.
  - d) Decreasing the column temperature.
- 5. Describe three general terms that can be adjusted to improve resolution in chromatographic separations and explain specific experimental changes that can be made to adjust these parameters.
- 6. In preparing a benzene/acetone gradient for a silica gel liquid chromatographic column (note, this is silica gel and not a bonded-phase material), is it desirable to increase or decrease the proportion of benzene as the column is eluted? Explain your answer.

$$\begin{array}{c} O\\ ll\\ CH_3CCH_3 \end{array} \qquad \qquad \text{Benzene} = C_6H_6\\ \text{Acetone} \end{array}$$

- 7. a) For a reversed-phase liquid chromatographic separation on a C-18 column, predict the elution order of n-hexane, n-hexanol, and 2-hexanone. Explain your answer.
  - b) Suppose the liquid chromatogram of these three compounds came out as shown below. What is the problem with this chromatogram (there is a specific chromatographic term to describe it) and explain specifically what you would do experimentally to improve the chromatography?
